 Collected On: 17/03/2026 1:04 AM  
 Reported On: 17/03/2026 2:32 PM

Investigation	Observed Value	Unit	Biological Reference Interval
<b>Creatinine, Serum</b> (Serum, Jaffes method (IDMS Traceable))	0.444	mg/dL	Premature: 0.29-1.04 Full term: 0.24-0.85

**Interpretation**

- Creatinine is a waste product formed in muscles from the high energy storage compound, creatine phosphate. The amount of creatinine produced is constant (unlike Urea) and is primarily a function of muscle mass.

Physiological factors affecting serum creatinine concentration includes age, gender, race, muscularity, exercise, Pregnancy, certain drugs, diet, dehydration and nutritional status.

Low serum Creatinine levels is seen in cases of low muscle mass like muscular atrophy, or aging.

High serum creatinine levels is seen in Acute and Chronic kidney disease, obstruction

Since a rise in blood creatinine is observed only with marked damage of the nephrons, it is not suited to detect early stage kidney disease.

**Electrolytes, Serum**

(Serum, ISE Indirect)

<b>Sodium, Serum</b>	135.7	mmol/L	131-144
----------------------	-------	--------	---------

**Interpretation:**

- Low levels are noted in prolonged vomiting or diarrhea, diminished reabsorption in the kidney and excessive fluid retention. High levels are seen in case of excessive fluid loss, high salt intake and increased kidney reabsorption

<b>Potassium, Serum</b>	5.64	mmol/L	3.2-5.5
-------------------------	------	--------	---------

Medical Remarks: - Kindly correlate clinically

**Interpretation:**

- Low levels are noted in reduced intake of dietary potassium or excessive loss of potassium from the body due to diarrhea, prolonged vomiting or increased renal excretion. High levels may be caused by dehydration or shock, severe burns, hemolysis, diabetic ketoacidosis, and retention of potassium by the kidney

<b>Chloride, Serum</b>	104.2	mmol/L	97-108
------------------------	-------	--------	--------

**Interpretation:**

- Low levels are noted in reduced dietary intake, prolonged vomiting and reduced renal reabsorption as well as some forms of acidosis and alkalosis. High levels are found in dehydration, kidney failure, some forms of acidosis, high dietary or parenteral chloride intake, and salicylate poisoning.
